Problems (13)

One bar per problem, from its onset to the day it resolved or to the last recorded event. Length is drawn from those dates, never from the Years column, which counts year boundaries crossed and is approximate by up to a year.

ongoing resolved

► Show the 13 rows

Prescriptions (8)

One lane per drug. Each mark is an order; the number above a mark is the Gap in days since the previous order of that same drug, which is why a first order has none. A single-order lane is a drug that was never renewed.

(No renewal pattern: every order is a first.

► Show the 8 rows

Measurements that matter (9)

Nine codes, always. Two readings each at most - the previous and the latest - so this is not a time series and the sparklines are not drawn against dates. The change is the endpoint's own sentence; the numbers beside it are the readings it compares.

Allergies (0)

The only safety resource in this set. Criticality is the risk the allergy poses, not how bad a reaction was - the record carries no reaction for any patient here, so no field on this page claims a severity.

None known. The record was searched and holds no allergies.

Visits (22)

Results and Reports are counted at the encounter. Both are drawn against a time axis rather than a row number, because two visits on one day arrive in insertion order and that order is a tiebreaker rather than a finding.

What the record is made of (12)

Twelve resource types. Clinical is exactly the eight types this report reads; billing and not-read are rows the record holds that no part of the pipeline fetches, and showing them is the point. There is no per-class total, because no endpoint serves one - the only total here is Clinical events in the header, which the contract guarantees equals the clinical rows.
